What is Cavity Free at Three?

Cavity Free at Three is a three-year, statewide effort to prevent oral disease in young children. The effort aims to engage dentists, physicians, nurses, dental hygienists, public health practitioners and early childhood educators in the prevention and early detection of oral disease in pregnant women, infants and toddlers.

What is the goal?

OUR GOAL IS SIMPLE: WE WANT ALL CHILDREN IN OUR STATE TO BE CAVITY FREE BY THE TIME THEY REACH AGE THREE.

Why worry about dental disease?

Dental disease is the number one chronic disease of children in America, yet, it is a preventable disease.

- Dental caries is the most common chronic childhood disease. 5 times as common as asthma; 7 times as common as hay fever.
- 80% of the disease is in 20% of the population. It is largely a disease of poverty.
- Dental disease affects children's ability to eat properly, grow, attend school and learn.

In Colorado,

- 18% of 2-4 year olds have dental caries; 16% have untreated decay.
- 45.7% of kindergarteners have dental caries; 26.9% have untreated decay.
- 57.2% of third graders have dental caries; 26.1% have untreated decay.
- By age 17, 78% of children have had at least one cavity; 7% have lost a permanent tooth to dental decay.
